Key words: Impact, crashworthiness, rigid body impact, impact of deformable bodies, collision, passive safety, occupant protection, accident reconstruction, automotive, aerospace, biomechanics, explicit finite element methods, meshless methods, computational solid mechanics.

ABSTRACT

The Mini-Symposium "Impact and Crash Mechanics" will gather together researchers from academia and industry working on new methods for impact and crash problems. This concerns engineering applications from automotive, aerospace, civil, and naval engineering as well as from biomechanical and material sciences. Methodological aspects from finite element and meshless methods will be regarded as well as material modeling and optimization.
