

Carlos B. da Silva is a computational scientist with interests in the physics and numerical simulation of turbulent flows using direct and large-eddy simulations (DNS/LES).

He teaches at the Mechanical Engineering Department of Instituto Superior Técnico/Technical University of Lisbon. His research interests focus on i) turbulent entrainment, ii) viscoelastic turbulence, iii) turbulent transport/passive scalars and, iv) turbulence radiation interactions (TRI), and he has published 30 papers. They include contributions to the energy cascade study in the context of large-eddy simulations (LES) and on physics of the interface separating turbulent and non-turbulent regions in jets.
